CopRice Working Dog Food

CopRice has been using an antioxidant pack in its Working Dog products for the last 6 years. This antioxidant pack is sourced from a reputable supplier and as CopRice understands, it is commonly used in the pet food industry. In February this year, CopRice changed its Working Dog packaging, and in the interests of transparency, CopRice chose to show the ingredient breakdown of the antioxidant pack, an element of which is a very low level of green tea extract.

CopRice acknowledges that the greyhound industry considers caffeine a banned substance, owing to the fact that it is considered a diuretic and a stimulant. CopRice notes that the level of caffeine in the CopRice Working Dog products is below the recognised threshold and as such, it is unlikely that a Greyhound fed only CopRice working Dog in accordance with the feeding guidelines would return a positive result for Caffeine. CopRice confirms that there has been no change to the recipe or ingredients contained in the Working Dog Product, nor to the recipe or ingredients of the of the antioxidant pack and notes that it is not aware of any Greyhound that has returned a positive result for caffeine while being fed CopRice working Dog. Furthermore, to support this position, CopRice submitted three separate samples of Working Dog to an independent laboratory for testing, none of which showed detectable levels of caffeine.

CopRice assures you that it is working with the Greyhound Association to have this matter rectified. If you require any further clarification or information, please do not hesitate to contact your CopRice representative who will put you in touch with our nutrition team.
